

Task 1: System Information

- Processor (CPU)
- Installed RAM
- Storage / SSD capacity

Task 2: Computer Hardware Diagram

Components

- CPU (Central Processing Unit) – Performs calculations and executes instructions.
- RAM (Random Access Memory) – Temporarily stores data and programs currently being used.

- Motherboard – Main circuit board that connects the computer's components.
- SSD/HDD – Provides permanent storage for the operating system, applications, and files.
- Power Supply Unit (PSU) – Converts and supplies electrical power to the computer components.
- USB Port – Used to connect devices such as keyboards, mice, USB drives, and external storage.
- HDMI Port – Used to transmit digital video and audio to a monitor or TV.
- LAN/Ethernet Port – Provides a wired network connection.

Task 3: Hardware Upgrades for Gaming or Video Editing

Component	Why it helps
RAM	More RAM allows more applications and larger projects to run simultaneously with less slowdown.
SSD	A faster SSD reduces boot times and makes applications, games, and project files load faster.
GPU	A powerful GPU improves gaming performance and accelerates video rendering and graphics processing.
CPU	A faster CPU improves overall performance, video encoding, multitasking, and CPU-intensive applications.
Cooling System	Better cooling helps prevent overheating and thermal throttling during gaming or heavy video editing.

Task 4: SSD vs HDD

Feature	SSD	HDD
---------	-----	-----

Technology	Uses flash memory with no moving parts.	Uses spinning magnetic disks and mechanical read/write heads.
Speed	Much faster for booting Windows, opening applications, and loading files.	Generally slower because it relies on mechanical movement.
Durability & Noise	More resistant to physical shock and operates silently.	More sensitive to physical shock and produces some mechanical noise.

Which is better for a student who wants fast boot times?

SSD is better.

- Faster boot time: An SSD can start the operating system much faster than a traditional HDD.
- Faster application loading: Programs and files open more quickly, making everyday computer use smoother.
- Better overall responsiveness: An SSD makes activities such as starting Windows, transferring files, and launching applications feel much faster.
